Femoral neck fractures in 45 children were submitted to open treatment (72.3%)
with Kuntscher nailing, wire fixation, and closed treatment with vertical extension
and plaster-of-Paris casts. The best results were obtained by Kuntscher nailing,
although the nail caused suppuration in a few cases (this also occurred after other
types of surgical treatment).

Title : Venography of the Lower Extremity.

Orig Pub: Chirurgia, 1957, 6, No 3, 400-408.

Abstract: Describes the method of direct venography by means of introducing into one of the external veins of the lower extremity of 20 ml of a 40% umbrathor together with 1 ml of 2% novocaine. The injection is performed after the application of an elastic tourniquet immediately over the ankle. Roentgenography of the lower third of the hip, of the knee joint, and of the upper two thirds of the lower leg gave good results.

Title : Gas Chromatography. II. Analysis of a Mixture
of Acetylene, Vinyl Chloride and Air. Analysis
of Chlorine-Hydrogen Mixture.

Orig. Pub. : Rev. chim., 1958, 9, No 3, 125-128

Abstract : A method has been worked out for separating a mixture of C₂H₂ (I), vinyl chloride (II) and air, in a coil-shaped glass column, 1.6 m long and 5 mm in diameter, filled with aluminum silicate (particle size 0.4-0.5 mm) impregnated with dibutyl phthalate (in an amount of 20.6%). Catharometer readings are recorded by a photographic procedure similar to that used in polarography. Calibration curves for II are of linear shape, those for I are non-linear, being linear only for concentrations below 2%. Mean error of analysis about 1%. Mixtures of H₂ and Cl₂ are poorly separated in columns with silica-gel and charcoal, better -- in a column with a

Title : Study of the Monodactyllic (One-Hoofed) Swine in the Romanian People's Republic

Orig Pub : Bul. stiint. Acad. RPR. Sec. biol. si stiinte. agric. Ser. agron., 1957, 9, No 2, 127-142

Abstract : Studies of monodactyllic swine showed that the second and third phalanges of their third and fourth toes underwent certain mutations. The third phalanx of the monodactyllic swine is the result of the complete fusion of both these toes, divided from each other by two surface folds. This combined third phalanx is provided with an intermediate bone of unknown origin. The membrana coriacea is thicker than in even-toes swine, and consequently the keratic box is thicker too. Its thickness equals not the thickness of the keratic layer but, as in a horse, the thickness of the

TITLE : About the One-hoofed (Solid) Pig in the
People's Republic of Rumania.

OP. I. 1958. : Proc. ..., August, 1958, 1, No 1, 74-85

ABSTRACT : In addition of Richard a pig breed is
reduced whose feet have only one hoof. This
characteristic, which is hereditary, is caused
by the adhesion of the terminal "tarantula"
(Galeodes aranoides). The structure of the
extremities (skeleton, muscles, the blood
supply system) is described and the peculiari-
ties which differentiate the Rumanian pig
from one-hoofed pigs of other countries are
noted. -- V. I. Tsalkin

TITLE: New Ways of Metal Machining

PERIODICAL: Metalurgia și Constructia de Mașini, 1960, Nr 1,
pp 18 - 23

ABSTRACT: The author explains that metal machining developed rapidly, both by the use of suitable material and by the improvement of machine tools, in general, of which he mentions those provided with cams and those mechanized or automated, with perforated conveyer belts, etc. He describes the copying system, which allows automation, whether parts are processed in large or small series. A hydraulic device for high-capacity copying lathes was recently turned out by the automated Machine Tool Plant in Kiev. This "UP-240" device is supplied by the plant as an attachment to the

"IA 62" and "DIP 260" lathes for the production of grooved axles, graduated bushings and conical parts. The "UF-240" device is maintained in longitudinal motion by the lead screw. If a small quantity of parts is turned on the lathe one of the pieces previously turned may be used as template. If it is a large lot of parts the template will have to be made of alloyed steel, thermally treated and ground. The operation of a copying system produced by the Etablissements de Vallière is also described. An interesting solution was worked out in the USSR, where an external grinding machine was automated by a device for the automatic regulation of radial pressure exercised by the grinding disk on the piece or part to be ground. This device is provided with a number of electric attachments, which continuously record the radial pressure. The rotating piece changes its speed to maintain the radial pressure near the optimum point, thus reducing the vibration and avoiding the deterioration caused by the excess-

sive temperature of the processed piece. The pieces are ground exactly in the dimensions prescribed. An automated production line for ratchet wheel processing was put into operation in the "Krasnyy proletariy" Machine Tool Plant in Moscow in 1958.

Ratchet wheels for parallel "IK 26" lathes will be processed by the new automated line, the annual production of which will be 120,000 ratchet wheels in 10 varieties, with an external diameter of 88 - 220 mm and with a module of 1.75 - 4 mm. The line is made up of 13 machines performing the following machining operations: frontal turning on the lathe of one side; frontal turning on the lathe of the second side; broaching of grooves and holes; hobbing; rounding-off of teeth by an end mill; and severing of

teeth. The parallel set of machines performing the above-mentioned operations includes 3 cutters for milling teeth, 1 for rounding off teeth, and a severing machine. There are 6 figures and 1 table.

Title : Concerning the Method of Indirect Determination of the
Amount of Combustion Products Issuing from Furnaces

Orig Pub : Studii si cercetari ener., 1955, 5, № 3-4, 575-578

Abstract : For furnaces with recuperative heating of the air a formula is proposed for the determination of the amount of combustion products: $D_c = kD_a \cdot (i_p - i_{ti}) / (i_e - i_{er})$, where D_c -- amount of combustion products, in $\text{nm}^3 \text{ hour}^{-1}$, D_a -- amount of air heated in the recuperator, i_p -- its enthalpy at the ingress, i_{ti} -- same at the egress, i_e -- enthalpy of the combustion products at the ingress, i_{er} -- same at the egress, k -- a coefficient which takes into account

the losses to the surrounding medium. The amount of fuel
is determined by means of the equation:

$B = D_E \sqrt{V_g + (\lambda - 1) V_o} / \lambda^2$, where λ -- coefficient of
air excess, V_g -- volume of combustion products formed per
1 kg of fuel, V_o -- theoretical amount of air per 1 kg of
fuel.

TITLE: Experimental investigation of natural gas combustion
in cylindrical tubes

PERIODICAL: Referativnyy zhurnal, Mekhanika, no. 3, 1962, 44,
abstract 33250 (Studii și cercetări energ. Acad. RPR,
1960, 10, no. 4, 827 - 833)

TEXT: Results are given of experimental investigations of the process of combustion of natural gas well mixed with air, in a tube of 52 mm diameter, with the length/diameter (l/d) ratio varying from 7 to 16. It is shown that in combustion without the stabilizer the maximum thermal output is 65×10^6 kcal/m² hr, while with the stabilizer it is 90×10^6 kcal/m²hr. [Abstractor's note: Complete translation].
